Abstract - Business intelligence dashboard tool is used for collecting, analyzing and presenting data using various techniques and methodologies for data visualization. Now-a-days for surviving in this competitive market, an enterprise should be quick in data sharing, accessing and generating fast insights so that flow of data in the enterprise remains continuous. BI dashboard helps the employees to create insightful dashboards on their own by utilizing various data visualization techniques. This review paper provides brief information of BI tools which helps in creating insightful dashboards. The tools that we've discussed in this paper are Tableau, Power BI, and Spago BI. A dashboard is also generated by using dataset from the UCI repository in one of the BI dashboard tool.

Index Terms - BI dashboard, BI tools, Power BI, Tableau, Spago BI.

I. INTRODUCTION

As BI tools have become very important for business and almost a need for every management, the right choice of BI tool is must. Number of BI tools is available in the market. So, sometimes it is confusing for customers which tool to use. This BI tool can be selected on the basis of various parameters like compatibility, usability, scalability, cost of using services etc. This paper examines the various Business intelligence tools available in the market which can be both open source and free or open source, which is less expensive of implementation for an enterprise. This report is being written with the goal of identifying a suitable tool for data visualization, dashboards and business intelligence in a company for business and management purposes.

A. Key features of BI tools

Here are some key features that one should keep in his mind while selecting BI tool.

1. Executive dashboards

Customized Visualizations provide important, effective, and continuous information to business founders, enabling faster and better interaction while reducing response time to both internal and external events. Executive require customized visualizations that provide simple KPI's and information on a regular, periodic basis. Exception reporting should also alert the executive to unanticipated situations or events that

necessitate action. Executives can make decisions quickly with customized content delivery because they don't have to shift through irrelevant data.

2. Location Intelligence

The ability to map and visualize data in topography formats is known as location intelligence. Discovering and visualizing datasets is reliant on spatial components that enable organisations to gain a new perspective on their business transactions, such as sales per region.

3. "What if" Analysis

"What if" analysis allows businesses to assess the potential consequences of important business decisions before they are made. Users can figure out procedures to accomplish business goals using existing data and avoid the default "hit or miss" approach. This aids the executives in carrying out precise critical planning.

4. Interactive Reports

Clients can use interactive reports to turn information into knowledge. They make it easier for clients to understand the evaluation contained in report, as well as the basic data upon which these other reports are based, allowing based better Decision-making. The client must be able to:

- Investigate and read reports thoroughly.
- Perform OLAP slice-and-dice operations.
- Apply assessment such as moving averages or recurrence to information to highlight trends.
- Use period scanning to band pass huge datasets to understand errors in their data.
- Set data notifications with data objections using data validation.

5. Meta Data Layer

A metadata layer simplifies presenting by eliminating the need for writing code and Sql, allowing clients as well as document authors to see it and view data in clear language. Users only interact with info at the Meta system-level, oblivious to the difficulties of the hidden information or data system.

6. *Ranking Reports*

This component enables you to create reports that include a request.

By selecting explicit models, explicit categories of data can be made from a variety of measurements. Positioning reports indicate you which components of your business are performing the best and which are performing the worst. For example, you could create a report that ranks your top ten best-selling items, areas, or salespeople.

II. TABLEAU

Tableau has made a point of emphasizing the most appealing aspect of simplest items. Tableau's intuitive drag & drop items allow anyone to inspect data. There is no scripting language involved; only analysis. Tableau is 10-100 faster than current systems at integrating and visualizing data. This is one of the major reasons why business professionals should choose this tool. Information is easily shared via the web and mobile devices. It connects to a variety of data sources. The dashboards are incredibly easy and rich in terms of the information awareness.

Tableau Products:

1. *Tableau Desktop*

Tableau is available in two versions: Expert edition, which supports all data resources and interactions with Tableau employee for web analysis and individual version, which only supports Excel, Access, as well as spreadsheets settings of data sources and does not provide worker support. Over a year, the two of them are approximated for professional reasons and available for academic reasons.

2. *Tableau Server*

Tableau Server is a flexible and internet business intelligence remedy. This is used to make visualizations with Tableau desktop and distribute them throughout your organization. Overall, IT maintains sources of data that are similar to Tableau server. Similarly, it supports all web browser on all devices and platforms.

3. *Tableau Online*

Tableau Online is a simple version of Tableau Server. It's used to share visualizations created with Tableau desktop with colleagues, partners as well as customers. It's simple to find responses in mins with this version---whenever and

anywhere users seem to be. It provides 100 Gb of data of space to store for the business license.

4. *Tableau Public*

Tableau Public (community edition) is for anyone who needs to use the internet to reveal effective data tales. You'll be able to interact with data, structure effective data conceptions, and allocate them directly to your website. This really is useful for those who provide a lot of content on the internet.

5. *Tableau Reader*

Tableau Reader is unlimited access application which allow users select to view Tableau Desktop Visualizations.

Figure 1: Tableau products offerings

Tableau Reader allows you to open and interact with visualisations created with Tableau Desktop, including data. However, if the writer has not yet built the affiliation, it won't allow it to be changed or played out.

III. POWER BI

In September 2013, Microsoft released Power BI for office 365, which is a version of Power BI. On July 24, 2015, Power BI was released to the general public for the first time. Power BI (Business Intelligence) is a cloud-based knowledge inquiry which can be used to analysis as well as notify information from a wide range of sources. Power BI is simple and easy to implement for both power consumers and business experts. Power BI is a fully grown as well as amazing tool which BI engineers can use in enterprise frameworks to model circumstances and mixture complex information.

Data Sources:

Power BI is all about information. All such conceptions as well as replies are getting truly from set of data for gathering information, generating graphs, visualisations, and involves initial with Q&A.

- Files
- Content Packs
- Databases

Power BI Workflow:

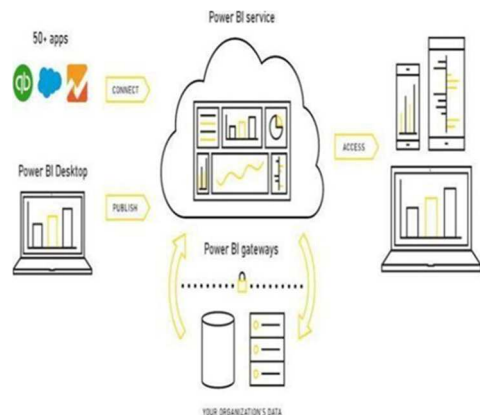

Figure 2: Power BI workflow

Features:

- Dashboards: Dashboards consolidate different data visualizations into solitary platform, simple approach to visualize key execution pointers.
- Visualizations: Visualizations include benchmarks, tree charts, funnel charts or fill charts.
- Connectors for SaaS services: These connectors work with Github, CRM, Salesforce, ERP, Sendgrid and Zendesk services.
- Live connectivity to SAAS services: Without transferring data from Microsoft SQL Server to the cloud and maintaining encrypted communications, cloud-based Power BI can help.
- Power BI Designer: It enables you import data, model it, publish Power BI updates without excel.

Benefits:

- Reports and Pre-assembled visualizations for SaaS arrangements.
- Real-live visualizations refreshes
- Live association with your information reports, protect, on premises or in the cloud.
- Utilising regular terminology instinctual inquiry of data.
- Safe trans connection, fast setup, and integration with existing IT structures are all advantages.

IV. DIAGRAM FOR VISUALIZING EVALUATION VALUES

In their examination, Jusselme et al. (2017) focused on identifying reasonable perception methods that increment the ease of use and the information extricated from the structure recreation informational collection. They made an evaluation lattice to choose which kind of graph best suits their motivation. We picked a similar procedure to find the best graph types for these order evaluation information.

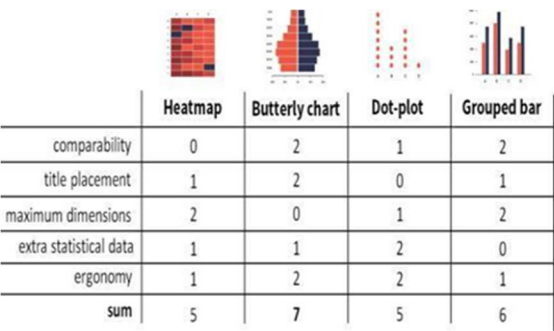

Figure 3. Assembled bar charts

We explored the conceivable outline types at the website page of data viz project [1], which is a comprehensive file of information representations. We picked four graphs to analyze in the assessment framework: heat map, butterfly outline, spot plot, and assembled bar charts. (Figure 3.) These diagrams should show the current presentation esteem and the necessity worth of an article simultaneously. They need to permit the watcher to think about these qualities along at any rate two controls. It ought to be straightforward, while it needs to show a lot of additional data: titles, other measurable information and markers. It should be versatile, so it stays flawless whether there are not many or various qualities. Subsequently, we made five evaluation viewpoints: equivalence, title position, maxi-mum number of measurements, ergonomics, and capacity to address extra measurable information. At that point we evaluated these four options on a zero-to-two scale, where zero isn't acceptable, one is acceptable, and two is superb. It worked out that the butterfly graph best suits our motivation, and assembled bar is marginally behind. Both may have their utilization cases: butterfly graph is better in contrasting two measurements profoundly and assembled bar is smarter to show an outline of the assessment.

Figure is an illustration of a butterfly outline showing the discipline upsides of item gatherings. Conflicts between present execution and necessity esteem are not difficult to find, while each item's esteem is comparable to the others or to the normal. The numbers toward the beginning and toward the finish of the bars are not difficult to peruse and identified with the relating object. These numbers can be either numbers or floating point numbers. The previous is a worth initially implied for the zero-to-ten scale, while the last demonstrates a changed over esteem, gotten from an actual unit of estimation.

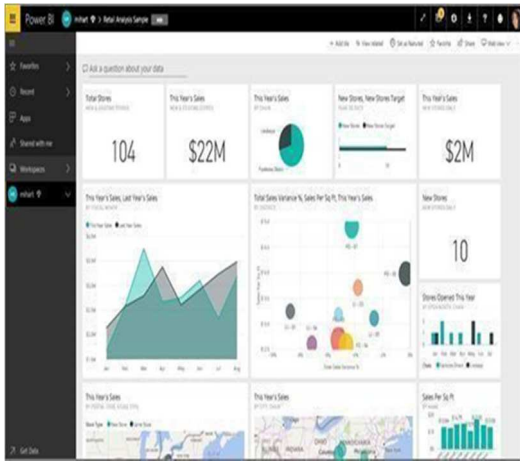

Figure 4

V. DASHBOARD DEVELOPMENT

Inside this segment, you'll see a description of dashboard progression. It only shows a portion of the overall dashboard. We have thought about demonstrating the graphic understanding of Sample details in the association. The dashboard addresses various perceptions to introduce our data in various formats. The dataset is taken from Oracle Database. We've used Power BI Desktop for experiment since Power BI has progressed highlights like connect to on-premises data through data connectivity portals attach real-time sources of data to create a fully interactive experience. Among other things, you can generate, display, and submit centralized additionally, the feature of Power BI to is availed to show the accessibility of Dashboard on the web guidance for enhancing the efficiency of BI&A system training for corporate users on the web.

VI. CONCLUSION & FUTURE WORK

There are numerous BI tools on the market. In this paper, we've looked at a few different types of business intelligence tools that can be useful. With the restricted assets and the expense of speculation, we investigated the instruments introduced in this paper. In any case, thinking about the size of association and beginning cost of speculation, the provider offers instruction, implementation and ongoing support for open source partially open source software.
